# Scenario-based Stochastic Programming

$$\max E_{\omega} \left[ \sum_{i=1}^{M-1} (n_{i} - s) (\sum_{j=1}^{N} x_{ij} + y_{i+1,\omega}^{+} - y_{i\omega}^{+}) + (n_{M} - s) (\sum_{j=1}^{N} x_{Mj} - y_{M\omega}^{+}) \right]$$
s.t. 
$$\sum_{j=1}^{N} x_{ij} - y_{i\omega}^{+} + y_{i+1,\omega}^{+} + y_{i\omega}^{-} = d_{i\omega}, \quad i \in [M-1], \omega \in \Omega$$

$$\sum_{j=1}^{N} x_{ij} - y_{i\omega}^{+} + y_{i\omega}^{-} = d_{i\omega}, \quad i = M, \omega \in \Omega$$

$$\sum_{j=1}^{M} n_{i}x_{ij} \leq L_{j}, j \in [N]$$

$$y_{i\omega}^{+}, y_{i\omega}^{-} \in \mathbb{Z}_{+}, \quad i \in [M], \omega \in \Omega$$

$$x_{ij} \in \mathbb{Z}_{+}, \quad i \in [M], j \in [N].$$

(1)

(HKUST) \*\*\* 6 / 21

## Two-stage

$$\max c' \mathbf{x} + z(\mathbf{x})$$
s.t. 
$$\mathbf{n} \mathbf{x} \leq \mathbf{L}$$

$$\mathbf{x} \in \mathbb{Z}_{+}^{M \times N},$$
(2)

where  $z(\mathbf{x})$  is the recourse function defined as

$$z(\mathbf{x}) := E(z_{\omega}(\mathbf{x})) = \sum_{\omega \in \Omega} p_{\omega} z_{\omega}(\mathbf{x}),$$

and for each scenario  $\omega \in \Omega$ ,

$$z_{\omega}(\mathbf{x}) := \max \quad \mathbf{f}' \mathbf{y}_{\omega}$$
s.t. 
$$\mathbf{x} \mathbf{1} + \mathbf{V} \mathbf{y}_{\omega} = \mathbf{d}_{\omega}$$

$$\mathbf{y}_{\omega} \ge 0.$$
(3)

11/1(CT) \*\*\* 7 / 21

## Solve the Second Stage Problem

$$\min_{\mathbf{x}.\mathbf{t}.} \alpha'_{\omega}(\mathbf{d}_{\omega} - \mathbf{x}\mathbf{1}) 
\text{s.t.} \alpha'_{\omega}\mathbf{V} \ge \mathbf{f}'$$
(4)

Let  $P = \{\alpha | \alpha' V \ge \mathbf{f}'\}$ . The feasible region of problem (4), P, is bounded. In addition, all the extreme points of P are integral.

## **Delayed Constraint Generation**

#### Restricted Benders Master Problem

$$\max \quad c'x + \sum_{\omega \in \Omega} p_{\omega} z_{\omega}$$
s.t. 
$$\sum_{i=1}^{M} n_{i} x_{ij} \leq L_{j}, j \in [N]$$

$$(\alpha^{k})'(\mathbf{d}_{\omega} - \mathbf{x}\mathbf{1}) \geq z_{\omega}, \alpha^{k} \in \mathcal{O}^{t}, \forall \omega$$

$$\mathbf{x} \geq 0$$

$$(5)$$

# Obtain the Feasible Seat Planning

- Step 1. Obtain the solution,  $x^*$ , from stochatic linear programming by benders decomposition.
- Step 2. Aggregate the solution to the supply,  $s_i^0 = \sum_i x_{ii}^*$ .
- Step 3. Obtain the optimal solution,  $x^1$ , from problem (7) by setting the supply  $s^0$  as the upper bound.
- Step 4. Aggregate the solution to the supply,  $s_i^1 = \sum_i x_{ii}^1$ .
- Step 5. Obtain the optimal solution,  $x^2$ , from problem (??) by setting the supply  $s^1$  as the lower bound.
- Step 6. Aggregate the solution to the supply,  $s_i^2 = \sum_i x_{ij}^2$ , which is the feasible seat planning.

# Seat Planning with Social Distancing

Group type  $[M] = \{1, \ldots, M\}$  Row  $[N] = \{1, \ldots, N\}$  Let  $n_i = i + s$  denote the new size of group type i for each  $i \in [M]$ . Let  $L_j = S_j + s$  denote the length of row j for each  $j \in [N]$ , where  $S_j$  represents the number of seats in row j.

Figure: Problem Conversion

- 4 ロ > 4 個 > 4 差 > 4 差 > - 差 - 夕 Q (P

#### **Formulation**

When  $|\Omega| = 1$  in problem (1), the stochastic programming will be

$$\max \sum_{i=1}^{M} \sum_{j=1}^{N} (n_{i} - s) x_{ij} - \sum_{i=1}^{M} y_{i}^{+}$$

$$\text{s.t.} \sum_{j=1}^{N} x_{ij} - y_{i}^{+} + y_{i+1}^{+} + y_{i}^{-} = d_{i}, \quad i \in [M-1],$$

$$\sum_{j=1}^{N} x_{ij} - y_{i}^{+} + y_{i}^{-} = d_{i}, \quad i = M,$$

$$\sum_{j=1}^{M} n_{i} x_{ij} \leq L_{j}, j \in [N]$$

$$\sum_{i=1}^{M} n_{i} x_{ij} \leq L_{j}, j \in [M]$$

$$y_{i}^{+}, y_{i}^{-} \in \mathbb{Z}_{+}, \quad i \in [M]$$

$$x_{ij} \in \mathbb{Z}_{+}, \quad i \in [M], j \in [N].$$

#### Formulation

$$\max \sum_{i=1}^{M} \sum_{j=1}^{N} (n_i - s) x_{ij}$$
s.t. 
$$\sum_{j=1}^{N} x_{ij} \le d_i, \quad i \in [M],$$

$$\sum_{i=1}^{M} n_i x_{ij} \le L_j, j \in [N]$$

$$x_{ij} \in \mathbb{Z}_+, \quad i \in [M], j \in [N].$$

<ロト < 回り < 巨り < 巨り < 巨り の Q ()

## Analysis

(HKUST) \*\*\* 17 / 2

## Example

Suppose the social distancing is one seat, then the new sizes of groups are 2, 3, 4, 5, respectively. The length of one row is L = 21 and the demand is  $[10, 12, 9, 8]_d$ . Then these patterns, (5, 5, 5, 5, 1), (5, 4, 4, 4, 4), (5, 5, 5, 3, 3), belong to  $I_1$ . For pattern 1,  $(5, 5, 5, 5, 1), P_1 = \{5\}$ , thus a group with a size smaller than 5 cannot be put in this pattern.

## **Properties**

- $\alpha_k$  indicates the number of items for pattern k.  $\beta_k$  indicates the left space for maximal pattern k. Notice that the left space is the true loss.
- Denote  $\alpha_k + \beta_k 1$  as the loss for pattern k, l(k). When l(k) reaches minimum, the corresponding pattern k is the optimal solution for a single row.
- If the group sizes are consecutive integers starting from 2,  $\{2,3,\ldots,u\}$ , then a greedy-based pattern is optimal, i.e., select the maximal group size, u, as many as possible and the left space is occupied by the group with the corresponding size. The loss is k+1, where k is the number of times u selected. Let  $S=u\cdot k+r$ .

(HKIIST) \*\*\* 10 / 21

- Let  $I_1$  be the set of patterns with the minimal loss.
- For a seat layout,  $\{S_1, S_2, \ldots, S_N\}$ , the total loss is  $\sum_j (\lfloor \frac{S_j+1}{u} \rfloor f((S_j+1) \mod u)).$  The maximal number of people assigned is  $\sum_j (S_j \lfloor \frac{S_j+1}{u} \rfloor + f((S_j+1) \mod u)).$
